

Synthetic Vocal Generation

Klangio's challenge for the Hackatune

Obtaining data for singing transcription is complicated

There is a lot of manual labor in obtaining good data for singing transcription

Listen to the audio

Make precise annotations

score.tsv

#	onset,offset,note	
17.209375	17.439583	54.000000
17.600000	18.000000	55.000000
18.000000	18.750000	57.000000
18.769792	19.193783	57.000000
19.210000	19.551042	57.000000
19.579167	20.143783	57.000000
20.479167	20.863542	59.000000
20.879167	21.279167	61.000000
21.289583	22.655208	62.000000
23.359375	23.750000	62.000000
23.750000	24.179167	61.000000

Export the notes
(onset, offset, pitch)

What you will be doing

Generate singing from scores!

#	onset	offset	note
17.209375	17.439583	54.000000	
17.600000	18.000000	55.000000	
18.000000	18.750000	57.000000	
18.769792	19.193783	57.000000	
19.210000	19.551042	57.000000	
19.579167	20.143783	57.000000	
20.479167	20.863542	59.000000	
20.879167	21.279167	61.000000	
21.289583	22.655208	62.000000	
23.359375	23.750000	62.000000	
23.750000	24.179167	61.000000	

Take existing annotations

Generate singing

Train a model from the
synthetic data

(Do not worry, we provide the code for this)

Challenge

What do you have to submit

#	onset,offset,note
17.209375	17.439583 54.000000
17.600000	18.000000 55.000000
18.000000	18.750000 57.000000
18.769792	19.193783 57.000000
19.210000	19.551042 57.000000
19.579167	20.143783 57.000000
20.479167	20.863542 59.000000
20.879167	21.279167 61.000000
21.289583	22.655208 62.000000
23.359375	23.750000 62.000000
23.750000	24.179167 61.000000

Your magic ✨
The code that generates the
singing from a score

The weights 💪
How good can a model
trained on your data
performed, compared to
one trained on **real** singing?
